

EXPERIMENT NO. 1

AIM:

To create an E-R model for an Indian e-commerce system by representing its major entities, their attributes, relationships, keys, weak entities, multivalued and composite attributes, Product specialization, cardinalities, and participation constraints.

OUTPUT:

1. The required entities of the e-commerce system were represented, including Customer, Product, Order, Order Item, Seller, Category, Payment, Delivery, and Address.
2. The relevant relationships among the entities were established to represent the working of the e-commerce platform.
3. The E-R diagram was constructed with primary keys, composite attributes, multivalued attributes, weak entities, and the specialization of the Product entity.
4. Suitable cardinality ratios and participation constraints were represented for the relationships between the entities.
